Key Events in Apollo 13 and the Underlying Physics

The Oxygen Tank Explosion

Physics Behind the Explosion

- The oxygen tank, a cryogenic vessel, contained supercooled liquid oxygen. The explosion resulted from a combination of:

- Over-pressurization due to a thermostat switch issue.
- Material fatigue in the tank's heating elements.
- The rapid phase change and expansion of supercooled liquid oxygen caused mechanical failure.

- Understanding pressure-volume relationships, governed by the ideal gas law, was crucial in analyzing the explosion.

Navigating Using Physics: The Lunar Trajectory and Course Corrections

- The spacecraft's trajectory was manipulated using rocket thrusters based on Newton's Third Law: every action (firing thrusters) produced an equal and opposite reaction.
- Orbital mechanics calculations were essential for "free-return" trajectories, ensuring a safe return path around the Moon.

Power Conservation and Energy Management

- With limited electrical power, engineers analyzed the conservation of energy to optimize battery usage.
- Thermal physics helped manage cabin temperature and prevent systems from overheating.

 - Thermal insulation to maintain habitable conditions.
 - Propellant management for course adjustments.

The "NASA Engineered Solution"

- The famous "squib switch" fix involved understanding electrical circuits and physics of ignition systems.

Re-Entry Physics and Safe Return

- The re-entry phase involved understanding aerodynamics, heat transfer, and g-force impacts on astronauts.
- The heat shield had to withstand extreme temperatures due to atmospheric friction, a classic example of thermodynamics and fluid mechanics.

Sample Physics Problems Inspired by Apollo 13

Problem 1:

The oxygen tank explosion increased the pressure inside the tank by 20%. Assuming the initial pressure was 2000 psi and temperature remained constant, what is the new pressure?

Solution:

Using the pressure increase formula:

$$P_{\text{new}} = P_{\text{initial}} \times (1 + \frac{\Delta P}{P_{\text{initial}}})$$

$$P_{\text{new}} = 2000 \times (1 + 0.20) = 2000 \times 1.20 = 2400 \text{ psi}$$

Problem 2:

If the spacecraft's velocity after a course correction burn was 1.5 km/s, and the mass of the spacecraft was 30,000 kg, what was the change in momentum caused by the thrusters?

Solution:

$$\Delta p = m \times \Delta v = 30,000 \times 1.5 \times 10^3 = 45,000,000 \text{ kg}\cdot\text{m/s}$$
