## Programming STM32: Core Concepts and Workflow

### Understanding the Development Workflow

Programming STM32 MCUs typically involves the following steps:

- Middleware and libraries: Leveraging vendor-provided libraries for peripheral abstraction.

## Deep Dive into Programming Techniques

### Register-Level Programming

At its most fundamental level, programming involves manipulating device registers directly. This approach offers maximum control but requires detailed knowledge of hardware specifications.

Example: Turning on an LED connected to GPIO pin

```
```c
```

```
// Enable GPIOA clock

RCC->AHB1ENR |= RCC_AHB1ENR_GPIOAEN;

// Set PA5 as output

GPIOA->MODER |= GPIO_MODER_MODE5_0;

// Turn on LED

GPIOA->ODR |= GPIO_ODR_OD5;

...

```

While instructive, this method is verbose and error-prone for complex applications.

Hardware Abstraction Libraries

To simplify development, STMicroelectronics provides Hardware Abstraction Layer (HAL) libraries, which encapsulate register manipulations in higher-level APIs.

Example: Using HAL to toggle an LED

```
```c

HAL_GPIO_WritePin(GPIOA, GPIO_PIN_5, GPIO_PIN_SET);

...

```

HAL libraries promote portability and reduce development time, especially for complex projects.

### Interrupts and Timers

Real-time responsiveness is often achieved through interrupts and timers.

Implementing a Timer Interrupt:

- Configure the timer peripheral.
- Enable the corresponding interrupt.
- Write an interrupt handler to execute at each timer overflow.

```
``c

void TIM2_IRQHandler(void) {

if (TIM2->SR & TIM_SR_UIF) {

TIM2->SR &= ~TIM_SR_UIF; // Clear interrupt flag

// Toggle LED or perform task

}

}

``
```

This approach allows for precise, asynchronous control over hardware events.
