Understanding the fuel flow path is essential for interpreting the system diagram and troubleshooting issues. The typical flow sequence involves several stages:

Step 1: Fuel Storage

Fuel begins its journey in the tank, where it is stored under controlled conditions. The tank's venting system prevents pressure buildup and allows for expansion.

Step 2: Fuel Pickup and Pumping

The electric fuel pump draws fuel from the tank through a pickup assembly. As it operates, it creates a pressurized flow that pushes fuel through the fuel line.

Step 3: Filtration

The fuel passes through the primary fuel filter, which traps dirt, water, and other contaminants, ensuring only clean fuel reaches the engine.

Step 4: Pressure Regulation

The fuel then flows through the pressure regulator, which maintains the necessary pressure for proper atomization and combustion.

Step 5: Distribution to Injectors

Pressurized fuel is delivered via the fuel rail to each fuel injector. The injectors receive signals from the ECU to spray precise amounts of fuel into the combustion chambers.

Step 6: Return Path

Excess fuel not used during combustion is routed back through the return line to the tank, helping maintain pressure stability.
