### 2. Can you explain the difference between a sales order, delivery, and billing document?

Answer:

- Sales Order: A formal request from a customer to purchase goods or services. It contains details like customer info, materials, quantities, and pricing. It serves as the primary document for initiating the sales process.

- Delivery Document: Generated after the sales order, it authorizes the shipment of goods. It confirms what is to be shipped and includes details like shipping date, items, and quantities.

- Billing Document: Created post-delivery, it invoices the customer for the delivered goods or services. It captures invoice details, payment terms, and taxes.

Explanation:

The sequence follows a logical flow: sales order → delivery → billing. Understanding this sequence is fundamental for interviewers to assess a candidate's grasp of the sales cycle.

### **3. What are condition types in SAP SD? Explain with examples.**

Answer:

Condition types in SAP SD define different pricing elements such as discounts, surcharges, taxes, or freight charges. They determine how prices are calculated and maintained.

Examples include:

- PR00: Price
- K007: Customer discount
- MWST: VAT tax
- ZF00: Freight charges

Explanation:

Each condition type has attributes like calculation type, condition class, and access sequence, which determine how SAP searches for the relevant condition records. Candidates should understand how to configure and assign condition types to pricing procedures for accurate pricing determination.

### **4. What is the purpose of the "Schedule Line" in SAP SD?**

Answer:

A schedule line in SAP SD specifies the delivery date and quantity for each item in a sales order. It helps in planning and executing timely deliveries by providing detailed scheduling information.

Explanation:

Schedule lines are critical in managing lead times, delivery commitments, and ensuring customer satisfaction. They also influence availability checks and transfer requirements during delivery processing.

## **5. How does SAP SD integrate with other modules like MM and FI?**

Answer:

SAP SD integrates seamlessly with other modules to ensure a cohesive business process:

- MM (Materials Management): When a sales order is created, SAP checks inventory levels from MM. During delivery, stock movements are recorded in MM, and procurement can be triggered if stock is insufficient.

- FI (Financial Accounting): Billing documents in SD generate accounting entries in FI, ensuring that revenue and receivables are accurately reflected in financial statements.

Explanation:

Integration points like delivery document updates in MM and billing postings in FI demonstrate SAP SD's role within the broader SAP ecosystem. Candidates should be able to articulate these linkages clearly.

## **6. What is the difference between "Pricing Procedure" and "Condition Technique"?**

Answer:

- Condition Technique: A method used in SAP to determine the correct conditions (prices, discounts, taxes) based on an access sequence. It defines how SAP searches for condition records.

- Pricing Procedure: An ordered sequence of condition types that SAP uses during pricing determination. It controls the calculation process and the sequence of condition types applied.

Explanation:

While condition technique is about the search logic for conditions, the pricing procedure orchestrates how these conditions are applied during sales document processing. Understanding this distinction helps in configuring accurate pricing strategies.

## 7. How do you define and assign a new sales document type in SAP SD?

Answer:

To define and assign a new sales document type:

- Create a new sales document type: Use transaction code `VOV8` to create a new type, specifying parameters like number assignment, item categories, and schedule line categories.
- Configure item categories and schedule line categories: Assign relevant item categories that determine allowed sales items.
- Assign the sales document type: Link the new sales document type to sales organizations, distribution channels, and division via configuration.

Explanation:

Sales document types control the processing and permissible data in sales documents. Proper configuration ensures that different sales scenarios (e.g., returns, quotations) are handled accurately.

Item categories define the type of items in a sales order and influence processing logic. Common item categories include:

- TAN (Standard item): Regular sales items.
- TANN (Free of charge item): Items delivered free of charge.
- ERS (External procurement sales): Items procured externally and sold directly.

- RE (Returnable item): Items that are returnable.

Significance:

Item categories control aspects like pricing, delivery, billing relevance, and item category determination during sales order processing. They ensure the correct handling of various sales scenarios.

## 9. What is the purpose of the "Availability Check" in SAP SD?

Answer:

Availability check ensures that the requested quantities are available for delivery by checking stock levels, planned receipts, and other factors. It helps in confirming whether a sales order can be fulfilled on the requested date.

Types of availability checks include:

- Availability check at delivery: Ensures stock is available at the time of delivery.
- Check at order entry: Confirms availability during sales order creation.

Explanation:

This process improves customer satisfaction by providing realistic delivery dates and helps in optimizing inventory management.

## 10. How do you handle returns and credit memos in SAP SD?

Answer:

Returns and credit memos are managed through specific sales document types (e.g., VA01 for return sales). The process involves:

- Creating a return order referencing the original sales document.
- Processing the return in the system, which updates stock and financial data.
- Generating a credit memo request, which then leads to the creation of a credit memo invoice.
