Sample Solutions to Common BUAD 660 Problems

Time Value of Money (TVM) Problems

Example Problem:

Calculate the present value of a \$10,000 future sum to be received in 5 years, assuming a discount rate of 8%.

Solution:

The present value (PV) is calculated using the formula:

$$[PV = \frac{FV}{(1 + r)^t}]$$

Where:

- $(FV = \$10,000)$
- $(r = 0.08)$
- $(t = 5)$

Calculating:

$$[PV = \frac{10,000}{(1 + 0.08)^5} = \frac{10,000}{(1.08)^5}]$$

$$[(1.08)^5 \approx 1.4693]$$

$$[PV = \frac{10,000}{1.4693} \approx \$6,801.78]$$

Answer:

The present value of \$10,000 received in 5 years at an 8% discount rate is approximately \$6,801.78.

Capital Budgeting Techniques

Example Problem:

A company is evaluating a project that requires an initial investment of \$50,000. The project is expected to generate annual cash flows of \$12,000 for 6 years. Calculate the Net Present Value (NPV) assuming a discount rate of 10%.

Solution:

NPV formula:

$$[NPV = \sum_{t=1}^n \frac{C_t}{(1 + r)^t} - C_0]$$

Where:

- $(C_t = \$12,000)$
- $(r = 0.10)$
- $(n = 6)$
- $(C_0 = \$50,000)$

Calculating the present value of annuity:

$$PV_{\text{annuity}} = C \times \left(\frac{1 - (1 + r)^{-n}}{r} \right)$$

$$PV_{\text{annuity}} = 12,000 \times \left(\frac{1 - (1 + 0.10)^{-6}}{0.10} \right)$$

Calculate:

$$(1 + 0.10)^{-6} = (1.10)^{-6} \approx 0.5645$$

$$PV_{\text{annuity}} = 12,000 \times \left(\frac{1 - 0.5645}{0.10} \right) = 12,000 \times \left(\frac{0.4355}{0.10} \right)$$

$$PV_{\text{annuity}} = 12,000 \times 4.355 \approx \$52,260$$

Now, subtract the initial investment:

$$NPV = 52,260 - 50,000 = \$2,260$$

Answer:

The project has an NPV of approximately \$2,260, indicating it is a favorable investment.

Cost of Capital and WACC Calculations

Example Problem:

Calculate the Weighted Average Cost of Capital (WACC) for a firm with the following data:

- Equity (E) = \$1,000,000, Cost of Equity (Re) = 12%
- Debt (D) = \$500,000, Cost of Debt (Rd) = 6%
- Corporate Tax Rate (Tc) = 30%

Solution:

WACC formula:

$$WACC = \frac{E}{E + D} \times Re + \frac{D}{E + D} \times Rd \times (1 - Tc)$$

Calculations:

$$E + D = 1,000,000 + 500,000 = \$1,500,000$$

$$WACC = \frac{1,000,000}{1,500,000} \times 12\% + \frac{500,000}{1,500,000} \times 6\% \times (1 - 0.30)$$

$$WACC = \frac{2}{3} \times 0.12 + \frac{1}{3} \times 0.06 \times 0.70$$

$$WACC = 0.6667 \times 0.12 + 0.3333 \times 0.042$$

$$WACC = 0.08 + 0.014$$

$$WACC \approx 0.094 \text{ or } 9.4\%$$

Answer:

The firm's WACC is approximately 9.4%.

Conceptual and Analytical Questions

Risk and Return Analysis

Sample Question:

Explain the relationship between risk and return in managerial finance.

Sample Answer:

In managerial finance, there is a direct relationship between risk and return. Generally, the higher the risk associated with an investment or project, the higher the expected return should be to compensate investors for bearing that risk. This relationship is fundamental to the Capital Asset Pricing Model (CAPM), which quantifies expected return based on systematic risk (beta). Managers must balance risk and return to maximize shareholder value, choosing projects that offer acceptable returns given their risk profiles while diversifying to reduce unsystematic risk.

Financial Planning and Forecasting

Sample Question:

Describe the purpose of financial forecasting in managerial finance.

Sample Answer:

Financial forecasting involves predicting a company's future financial performance based on

historical data, market conditions, and strategic plans. Its purpose is to help managers plan for future capital needs, assess the viability of projects, manage cash flows, and develop budgets. Accurate forecasts enable better decision-making, risk management, and strategic growth, ensuring the firm maintains financial stability and capitalizes on opportunities.

Detailed Solutions to Common Problems in Chapter 10

The chapter provides numerous problems designed to test understanding and application of investment concepts. Here, we delve into typical solutions and strategies for tackling these problems.

Problem 1: Calculating Portfolio Expected Return and Variance

Scenario:

An investor holds a portfolio of two assets, A and B. Asset A has an expected return of 8%, and Asset B has an expected return of 12%. The weights are 60% in Asset A and 40% in Asset B. The covariance between the two assets is 0.0025, and their standard deviations are 0.10 and 0.15, respectively.

Solution Steps:

- Calculate the Expected Portfolio Return:

$$E(R_p) = w_A \times E(R_A) + w_B \times E(R_B)$$

$$E(R_p) = 0.6 \times 8\% + 0.4 \times 12\% = 4.8\% + 4.8\% = 9.6\%$$

- Calculate Portfolio Variance:

$$\sigma_p^2 = w_A^2 \times \sigma_A^2 + w_B^2 \times \sigma_B^2 + 2 \times w_A \times w_B \times \text{Cov}(A,B)$$

Convert standard deviations to variances:

$$\sigma_A^2 = 0.10^2 = 0.01$$

\[

$$\sigma_B^2 = 0.15^2 = 0.0225$$

\]

Plug in values:

\[

$$\sigma_p^2 = (0.6)^2 \times 0.01 + (0.4)^2 \times 0.0225 + 2 \times 0.6 \times 0.4 \times 0.0025$$

\]

\[

$$= 0.36 \times 0.01 + 0.16 \times 0.0225 + 2 \times 0.6 \times 0.4 \times 0.0025$$

\]

\[

$$= 0.0036 + 0.0036 + 0.0012 = 0.0084$$

\]

- Calculate Portfolio Standard Deviation:

\[

$$\sigma_p = \sqrt{0.0084} \approx 0.0916 \text{ or } 9.16\%$$

\]

Result:

Expected return = 9.6%, Standard deviation = 9.16%

Problem 2: Constructing an Efficient Portfolio

Scenario:

Given three assets with the following expected returns and variances:

| Asset | Expected Return | Variance | Standard Deviation |

|-----|-----|-----|-----|

| X | 10% | 0.0225 | 15% |

| Y | 12% | 0.036 | 18.97% |

| Z | 8% | 0.0156 | 12.5% |

The correlations between assets are provided, and the goal is to find the portfolio with the maximum Sharpe ratio.

Solution Approach:

- Determine the risk-free rate (assumed, e.g., 3%) for Sharpe ratio calculation.
- Calculate the expected return and standard deviation for different weight combinations to identify the optimal portfolio.
- Use quadratic programming or software tools (like Excel Solver or R) for precise optimization, but conceptually:
 - Maximize the Sharpe ratio:
$$\text{Sharpe Ratio} = \frac{E(R_p) - R_f}{\sigma_p}$$
 - Subject to constraints:

$$\backslash$$

$$w_X + w_Y + w_Z = 1$$

$$\backslash$$
$$\backslash$$

$$w_i \geq 0$$

$$\backslash$$

- Identify the weights that yield the highest ratio, representing the most efficient portfolio.

Applying Chapter 10 Solutions in Real-World Scenarios

Understanding the solutions to textbook problems enables investors and financial analysts to make informed decisions. Here are practical ways to apply these solutions:

1. Diversification Strategy Development

- Use covariance and correlation data to construct portfolios that minimize risk for a given return.
- Regularly rebalance portfolios to maintain optimal diversification.

2. Asset Allocation Planning

- Apply efficient frontier concepts to set strategic asset mixes aligned with risk tolerance.
- Incorporate tactical adjustments based on market outlooks.

3. Risk Management and Performance Evaluation

- Use beta coefficients and CAPM to assess asset contributions and expected returns.
- Calculate risk-adjusted performance metrics like the Sharpe ratio for portfolio evaluation.

4. Investment Decision-Making

- Use expected return and variance calculations to compare different investment options.
- Optimize portfolios to maximize returns while controlling for volatility.

Common Challenges and Tips for Success in Solving Chapter 10 Problems

- Understand the statistical concepts: Covariance, correlation, variance, and standard deviation are foundational.

Applying the Principles: A Closer Look at Key Topics

Time Value of Money (TVM)

The solutions often involve calculating present and future values using formulas such as:

- $PV = \frac{FV}{(1 + r)^n}$
- $FV = PV \times (1 + r)^n$

where PV is present value, FV is future value, r is the discount rate, and n is the number of periods.

Sample solution approach:

- Identify the known variables.
- Determine the appropriate formula.
- Plug in the values and compute.
- Interpret the result in context.

Risk and Return

The solutions illustrate calculating expected returns and measuring risk through metrics like variance and standard deviation:

- Expected Return: $E(R) = \sum p_i \times R_i$
- Variance: $\sigma^2 = \sum p_i \times (R_i - E(R))^2$

These calculations help in understanding investment attractiveness and portfolio diversification.

Cost of Capital

The solutions guide students through calculating the weighted average cost of capital (WACC):

$$WACC = \frac{E}{V} \times R_e + \frac{D}{V} \times R_d \times (1 - T_c)$$

where:

- E = Equity value
- D = Debt value
- V = Total value ($E + D$)
- R_e = Cost of equity
- R_d = Cost of debt
- T_c = Corporate tax rate

Step-by-step, the manual demonstrates how to estimate each component accurately.

Common Investment Problems and Their Solutions

To illustrate the value of the solutions, let's explore some typical problems encountered in the textbook, along with their core approaches and key takeaways.

Calculating Future Value and Present Value

Problem: An investor plans to deposit \$5,000 annually into an investment account that pays a 6% annual interest rate. What will be the value of the account after 20 years?

Solution Approach:

- Recognize this as an ordinary annuity problem.
- Use the future value of an annuity formula:

$$FV = P \times [(1 + r)^n - 1] / r$$

where:

- P = annual payment (\$5,000)
- r = annual interest rate (0.06)
- n = number of years (20)

- Plug in the numbers:

$$FV = 5,000 \times [(1 + 0.06)^{20} - 1] / 0.06$$

- Calculate:

$$FV = 5,000 \times [(3.2071) - 1] / 0.06 = 5,000 \times 2.2071 / 0.06$$

$$FV = 5,000 \times 36.784 = \$183,920$$

Key Takeaway: Regular investments grow significantly over time due to compounding, emphasizing the importance of starting early.

Evaluating Investment Risk and Return

Problem: Two stocks are considered: Stock A has an expected return of 8% with a standard deviation of 10%, while Stock B has an expected return of 12% with a standard deviation of 20%. Which stock offers a better risk-adjusted return?

Solution Approach:

- Calculate the Sharpe ratio for each stock:

$$\text{Sharpe Ratio} = (\text{Expected Return} - \text{Risk-Free Rate}) / \text{Standard Deviation}$$

- Assume a risk-free rate of 2%.

- For Stock A:

$$\text{Sharpe_A} = (8\% - 2\%) / 10\% = 6\% / 10\% = 0.6$$

- For Stock B:

$$\text{Sharpe_B} = (12\% - 2\%) / 20\% = 10\% / 20\% = 0.5$$

Conclusion: Stock A provides a higher risk-adjusted return, making it a more attractive investment relative to its risk.

Key Takeaway: Risk-adjusted measures like the Sharpe ratio help investors compare assets with different risk profiles effectively.

Practical Application: Developing an Investment Portfolio

Solutions in the textbook often guide learners through constructing diversified portfolios aligned with their risk tolerance and financial goals.

Step 1: Assessing Risk Tolerance

- Conservative investors prioritize capital preservation.
- Aggressive investors seek maximum growth.

Step 2: Asset Allocation

- Based on risk tolerance, allocate assets across stocks, bonds, and other investments.
- For example, a moderate investor might choose 60% stocks and 40% bonds.

Step 3: Selecting Investment Vehicles

- For stocks: individual stocks, mutual funds, ETFs.
- For bonds: government, municipal, corporate bonds.

Step 4: Rebalancing and Monitoring

- Periodically review portfolio performance.
- Rebalance to maintain desired allocation.

Example of a Solution Approach:

Suppose an investor with a moderate risk profile wants a \$500,000 portfolio in 15 years.

- Assume an average annual return of 7%.
- Use the future value of a lump sum:

$$PV = FV / (1 + r)^n$$

$$PV = 500,000 / (1 + 0.07)^{15} \approx 500,000 / 2.759 \approx \$181,250$$

- The investor needs to invest approximately \$181,250 today, or plan periodic contributions to reach the goal.

Key Takeaway: Systematic planning and disciplined investing, guided by solutions and formulas, are essential for achieving long-term financial objectives.

Behavioral and Ethical Considerations in Investing

The solutions also emphasize the importance of understanding investor psychology and ethical investing:

- Common biases: overconfidence, herd behavior, loss aversion.
- Impact on decisions: irrational behaviors can lead to poor investment choices.
- Ethical investing: incorporating social responsibility and environmental considerations into investment decisions.

Solutions often include case studies and scenarios illustrating these principles, helping learners develop a balanced approach to investing.
