Question:

Which of the following hormones primarily regulates blood calcium levels?

- a) Parathyroid hormone
- b) Calcitonin
- c) Insulin
- d) Thyroxine

Answer:

- a) Parathyroid hormone

Explanation:

Parathyroid hormone (PTH) increases blood calcium levels by stimulating bone resorption, enhancing calcium reabsorption in the kidneys, and activating vitamin D to increase intestinal calcium absorption. Calcitonin, on the other hand, decreases blood calcium levels by inhibiting osteoclast activity. Insulin and thyroxine are involved in glucose metabolism and thyroid function, respectively, and are not directly related to calcium regulation.

Sample Physiology I MCQ and Explanation

Question:

Which of the following ions is primarily responsible for the depolarization phase of the action potential in a neuron?

- A) Potassium (K^+)
- B) Sodium (Na^+)
- C) Calcium (Ca^{2+})
- D) Chloride (Cl^-)

Answer:

B) Sodium (Na⁺)

Explanation:

During the depolarization phase of neuronal action potential, voltage-gated sodium channels open, allowing Na⁺ ions to rush into the cell. This influx causes the membrane potential to become more positive, leading to depolarization. Potassium ions (K⁺) mainly contribute to repolarization, calcium is involved in synaptic transmission, and chloride typically stabilizes the resting membrane potential.
