## 5. Theorems Involving Chords, Secants, and Tangents

- Chord-Chord Power Theorem: If two chords intersect inside a circle, the products of the segments are equal.
- Secant-Secant Power Theorem: When two secants intersect outside a circle, the products of external and total segments are equal.

## Sample Problems and Solutions

### Problem 1: Find the measure of an inscribed angle

Given: An inscribed angle intercepts an arc measuring  $120^\circ$ .

Solution:

Using the inscribed angle theorem:

$\backslash$

$$\text{Inscribed angle} = \frac{1}{2} \times \text{intercepted arc} = \frac{1}{2} \times 120^\circ = 60^\circ$$

$\backslash$

### Problem 2: Find the length of an arc

Given: Radius  $(r = 10)$  units, central angle  $(\theta = 60^\circ)$ .

Solution:

$\backslash$

$$L = \frac{\theta}{360^\circ} \times 2\pi r = \frac{60^\circ}{360^\circ} \times 2\pi \times 10 = \frac{1}{6}$$

$\times 20\pi \approx 10.47 \text{ units}$

]

### Problem 3: Determine if a line is tangent

Given: A circle centered at (0,0) with radius 5, and a line  $(y = 12)$ .

Solution:

Calculate the distance from the center to the line:

[

$$d = \frac{|0 \times 0 + 0 \times 12 + c|}{\sqrt{0^2 + 1^2}} = |c|$$

]

In standard form, the line is  $(y = 12)$ , or  $(0x + 1y - 12 = 0)$ .

Distance from (0,0):

[

$$d = \frac{|0 + 0 - 12|}{\sqrt{0^2 + 1^2}} = 12$$

]

Since the distance (12) is greater than the radius (5), the line does not touch the circle; hence, it is not tangent.
